receiving a message at a computing device;
determining that a message header in the message indicates that the message relates to a fragment and that the fragment is cacheable, wherein the message header comprises no-cache directive data for not caching the fragment for non-fragment-supporting cache management units and caching directive data for caching the fragment for fragment-supporting cache management units;
determining whether a cache management unit is a non-fragment-supporting cache management unit or a fragment-supporting cache management unit;
processing the no-cache directive data to generate a no-cache instruction to a non-fragment-supporting cache management unit; and

processing the caching directive data to generate a no-cache instruction to a non-fragment-supporting cache management unit;
retrieving a set of dependency identifiers from the message, wherein a dependency identifier is generated by a server that originated the fragment;
storing the set of dependency identifiers in association with a source identifier for the fragment;
receiving an invalidation request message;
retrieving a dependency identifier from the invalidation request message;
determining a set of fragments that are associated with the dependency identifier; and
